Hippocampal Lesions

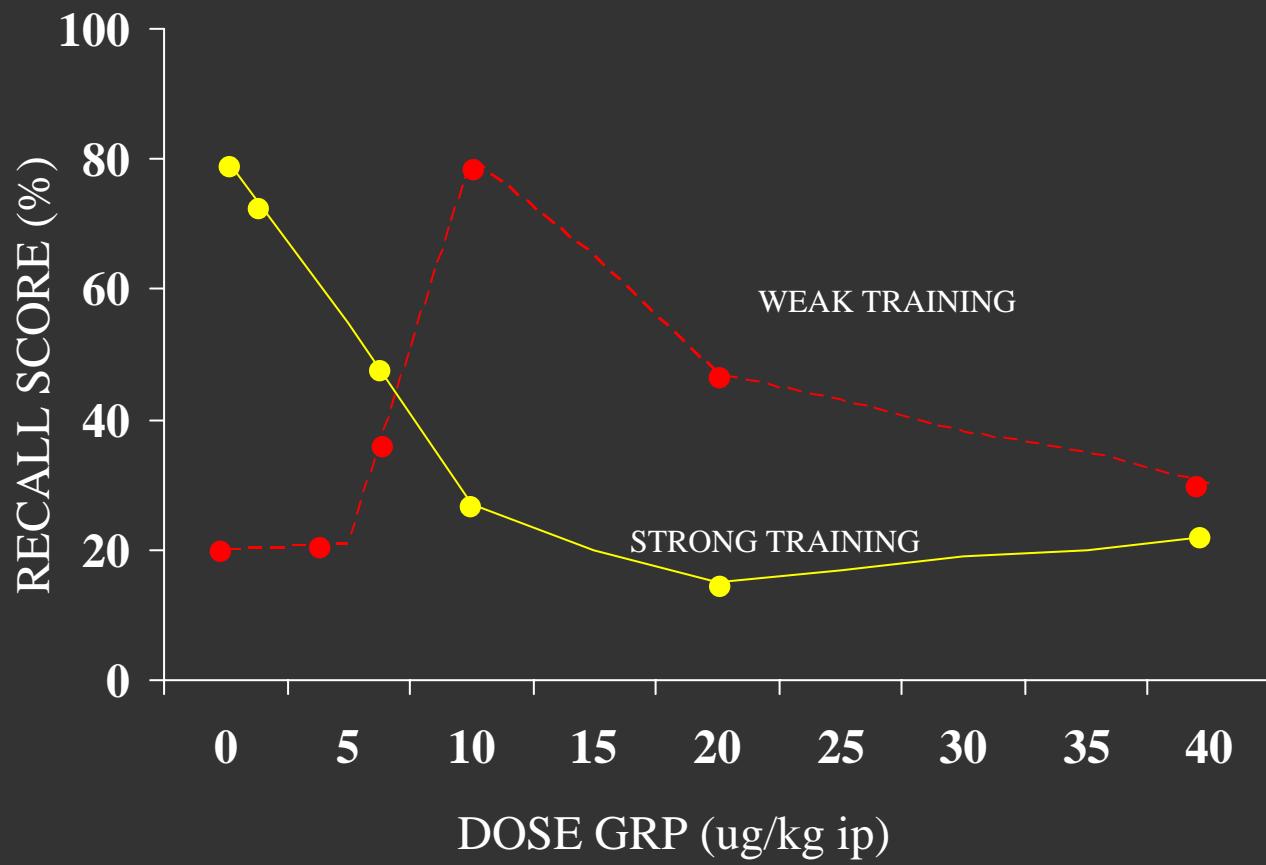

Septal Lesions

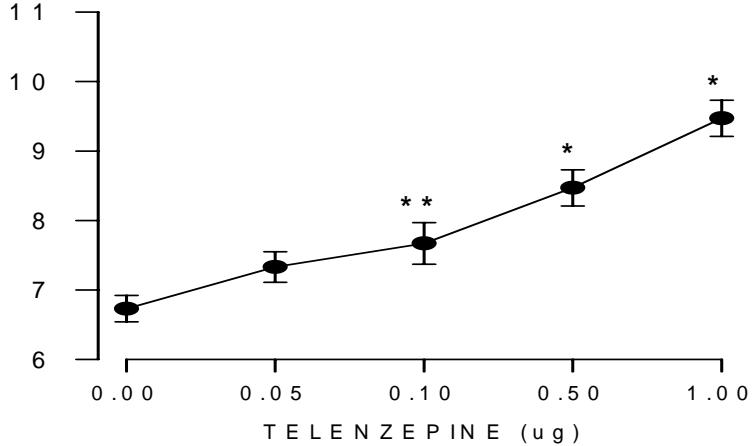

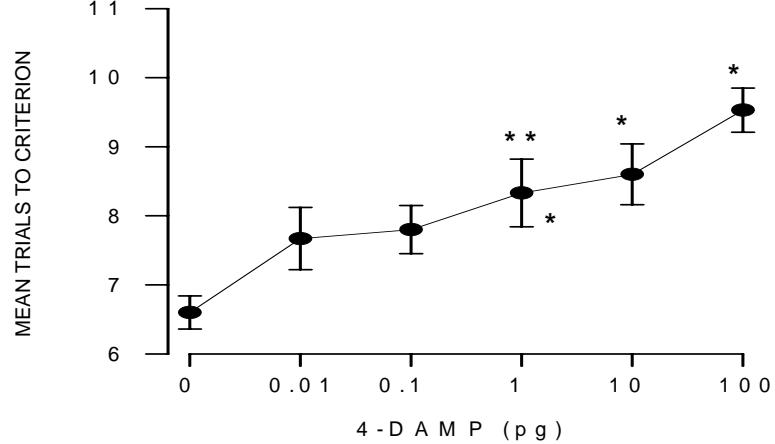

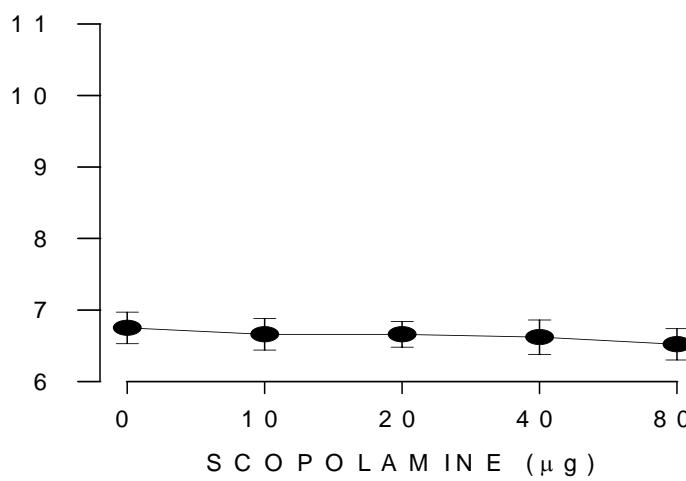

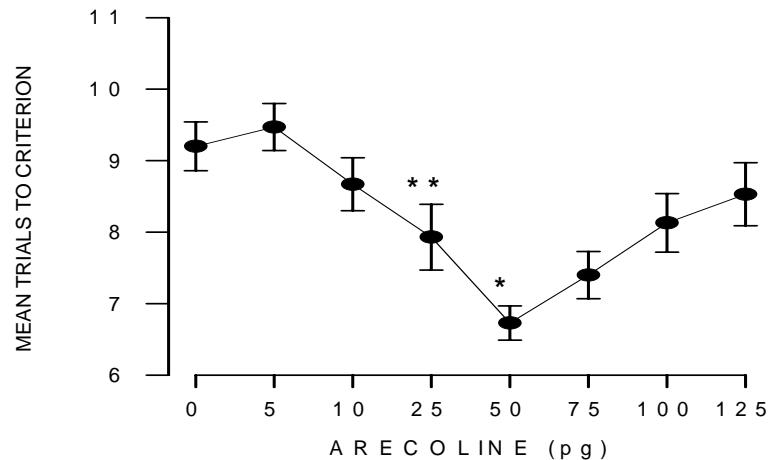

# THE GOLDEN RULES OF MEMORY ENHANCEMENT

- 1.All memory enhancers impair memory at higher doses.--- Bell shaped or inverted-U dose response
- 2.Memory enhancers impair memory in overtrained animals

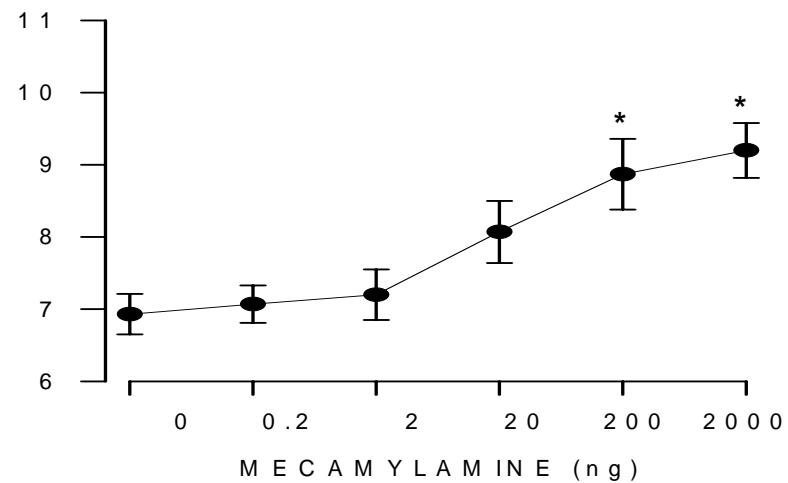

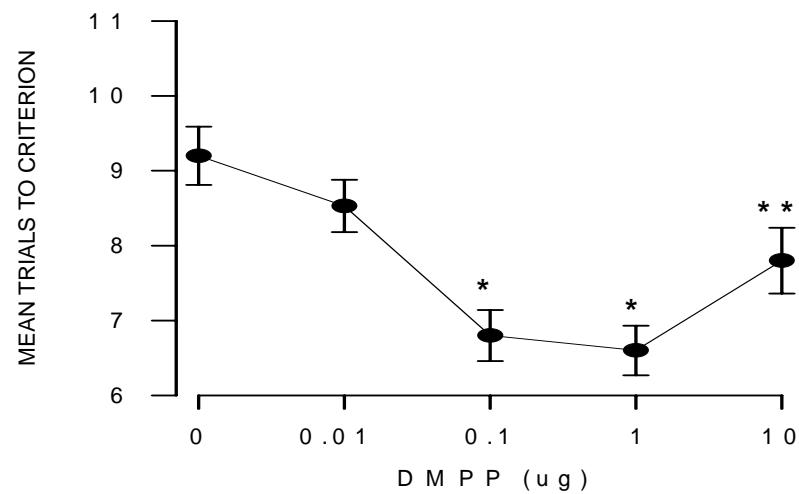

# ACETYLCHOLINE - MUSCARINIC RECEPTOR HIPPOCAMPUS

# ACETYLCHOLINE HIPPOCAMPUS

Nicotinic Receptor Agonist and Antagonist

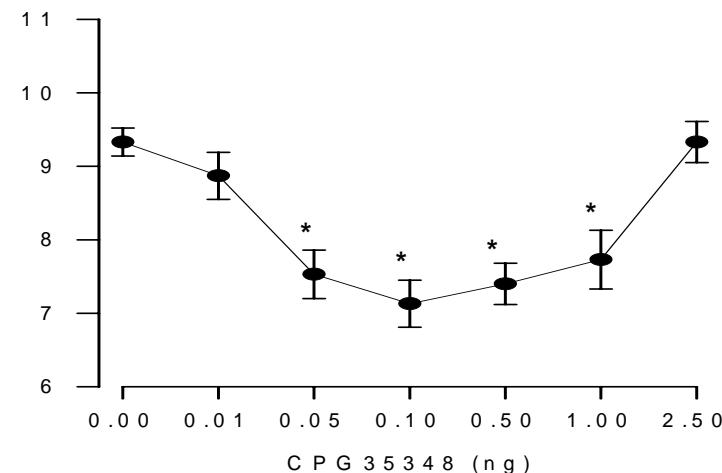

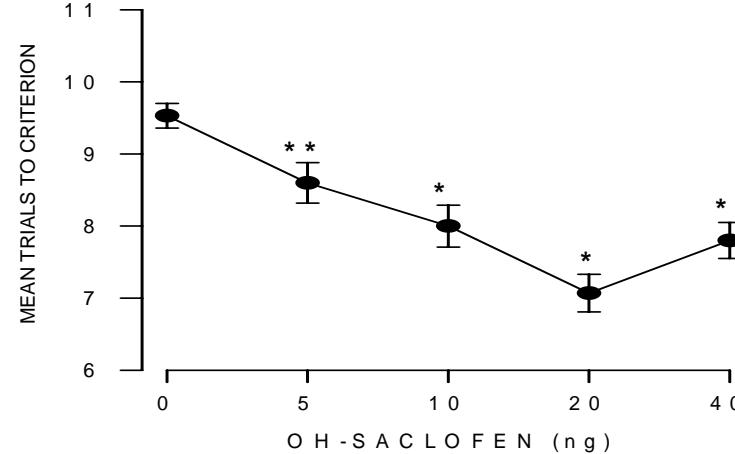

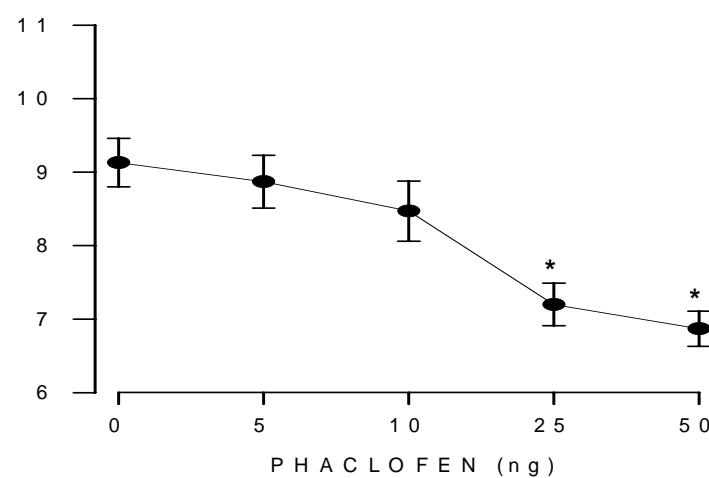

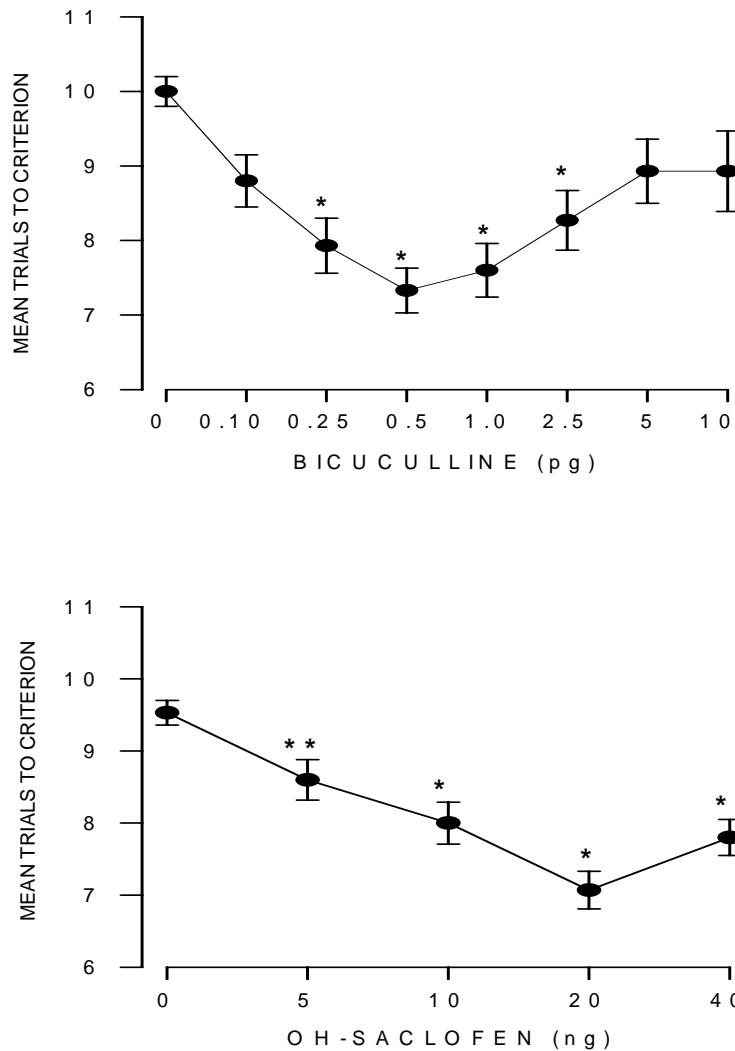

# Meta-analysis : Cholinesterase Inhibitors

- 9% more global responders to ChEI than placebo; 8% higher adverse events....less with donepezil

*Lanctot et al CMAJ 169:557,2003*

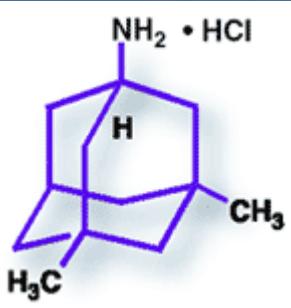

*“ Flawed methods and small clinical benefits...make recommendations for treatment questionable ”*

# GABA HIPPOCAMPUS

# Neurotransmitters demonstrating memory hormesis

- Cholinergic
- GABAergic
- Serotonergic
- Glutameric/NMDA
- Histaminergic (H<sub>2</sub> & H<sub>3</sub>)
- Dopaminergic
- Norepinehrinergic

# Memantine : Meta-analysis Cochrane Database

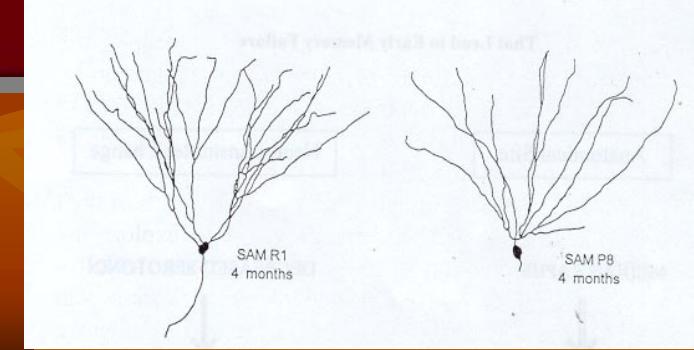

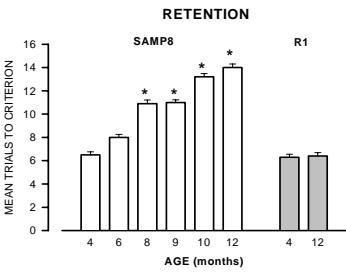

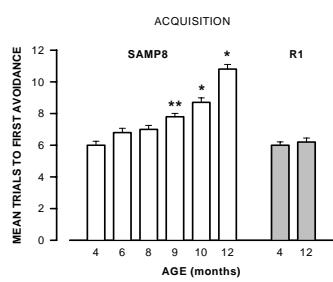

- Improved behavior (2.76/144)
- Improved ADLs (1.27/54)
- Decreased Agitation (8% vs 12%)

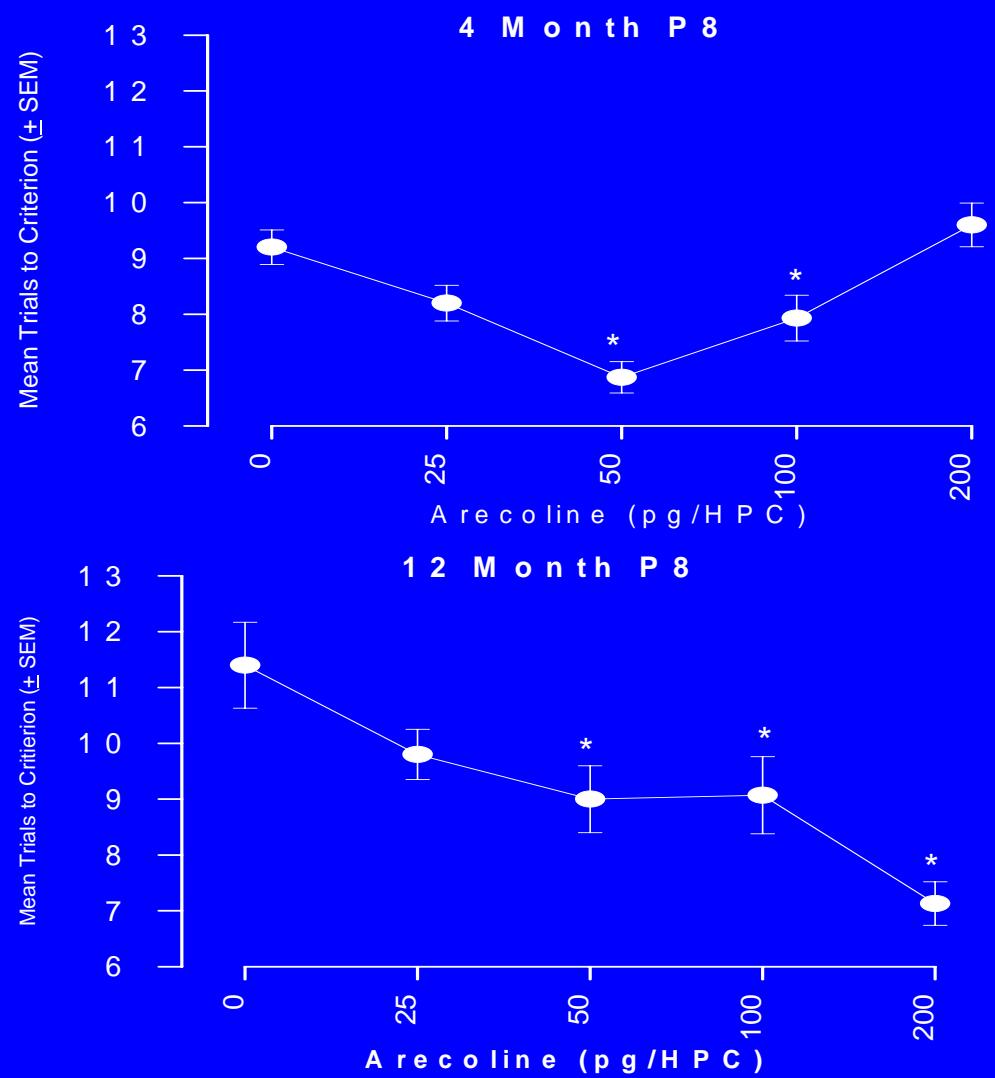

? DUE TO DECREASED NMDA ACTIVITY  
DECREASING PAIN

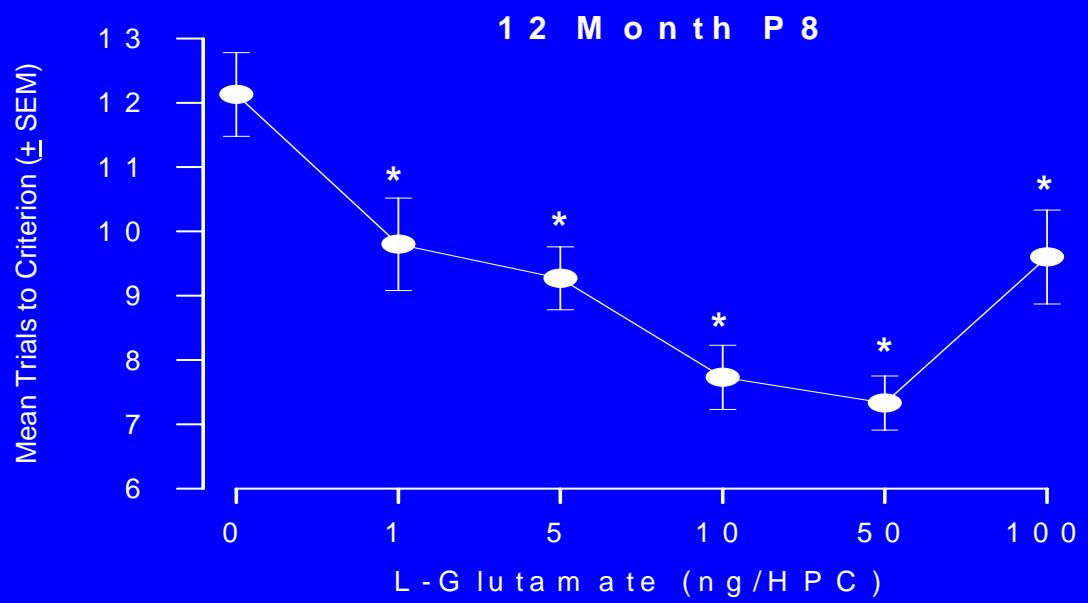

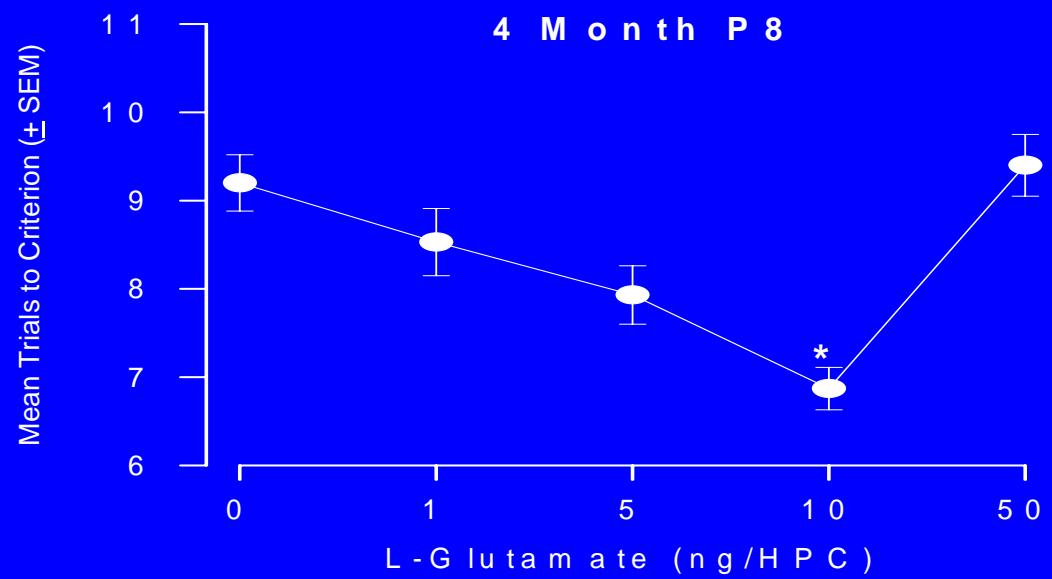

# The Third Golden Rule

3. Memory impaired animals have altered dose responses curves

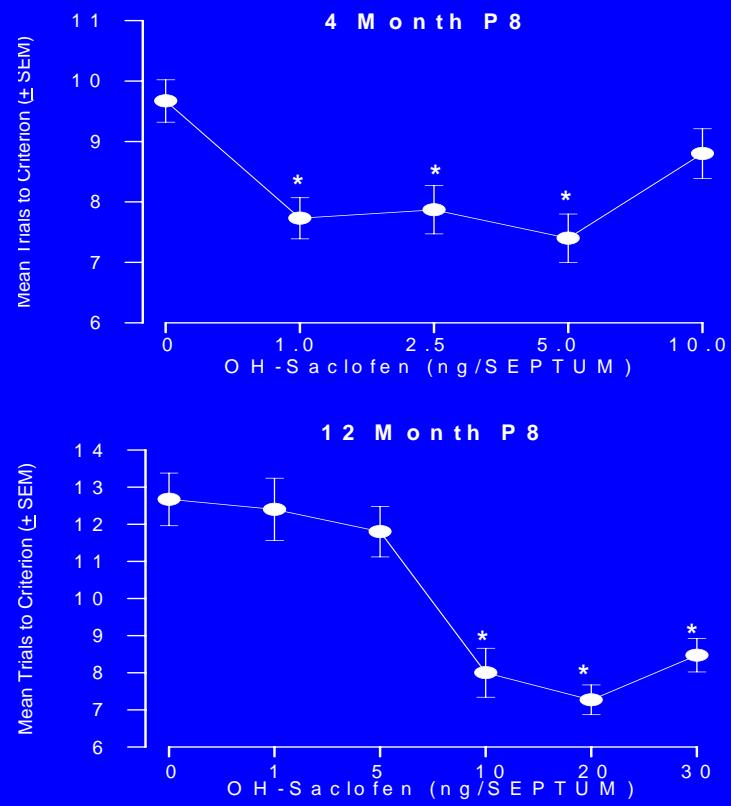

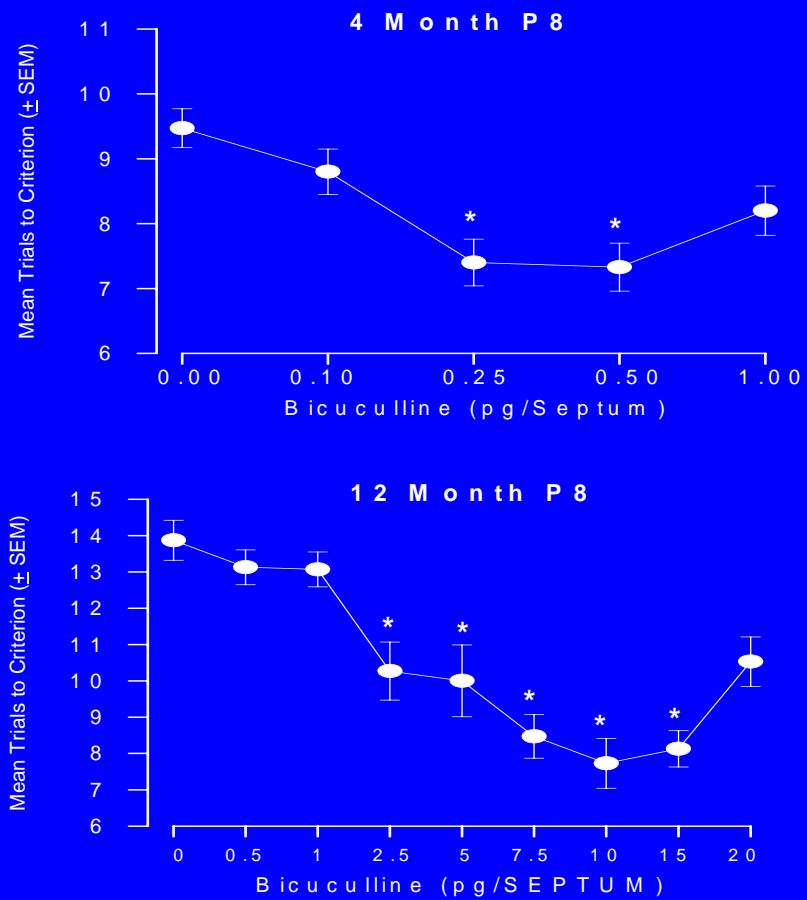

# SAMP8 MOUSE

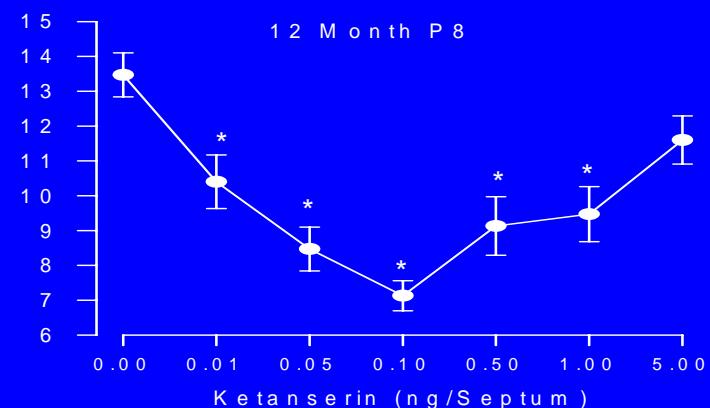

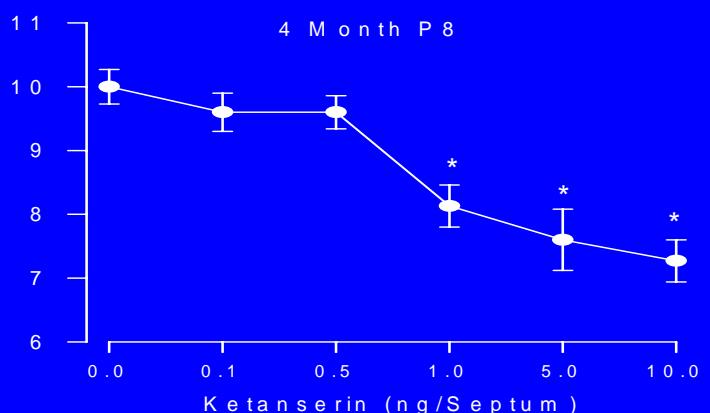

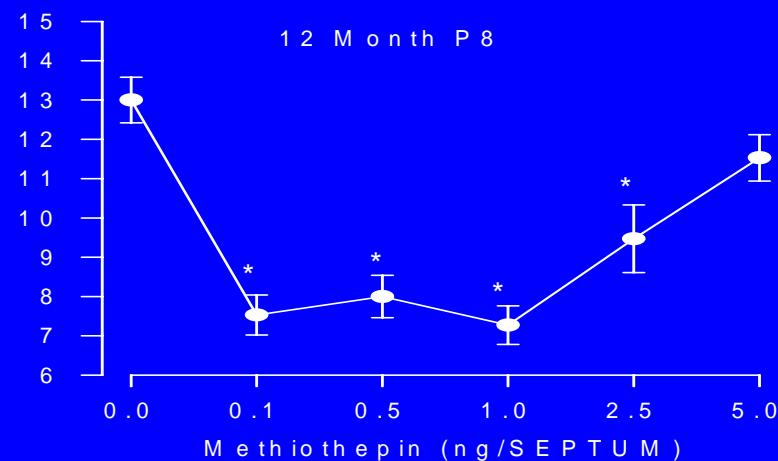

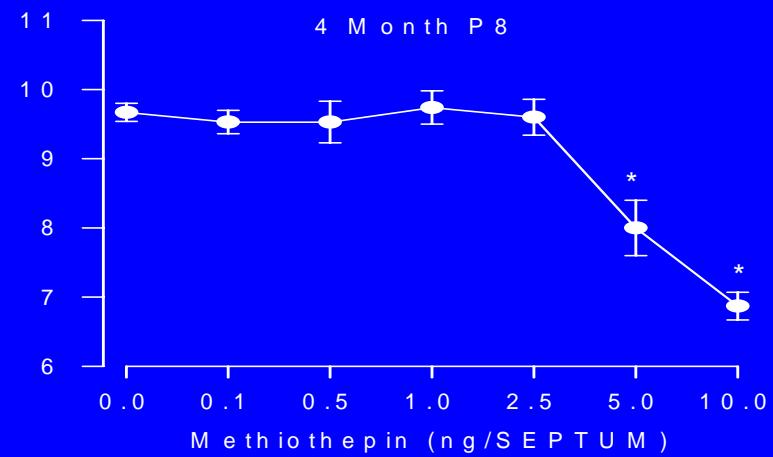

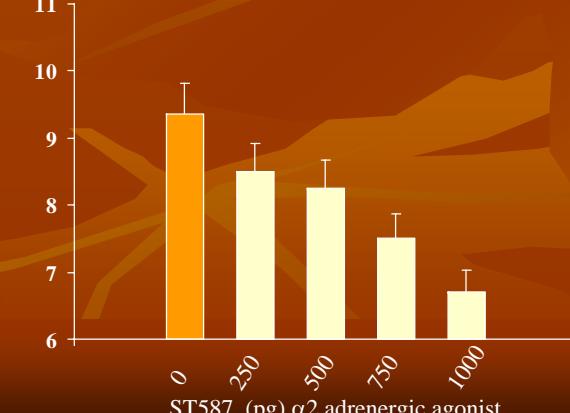

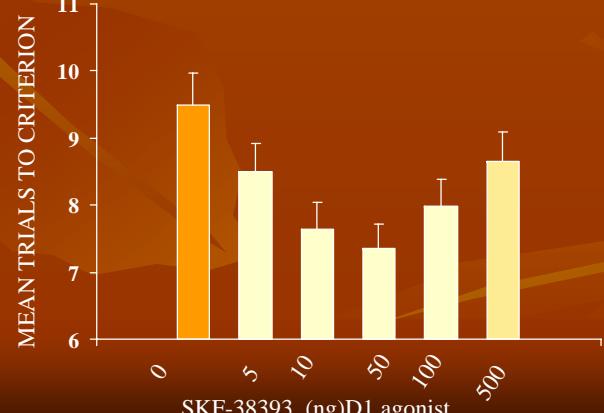

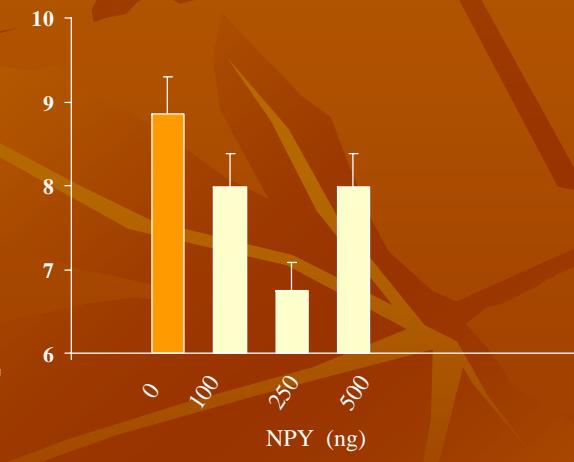

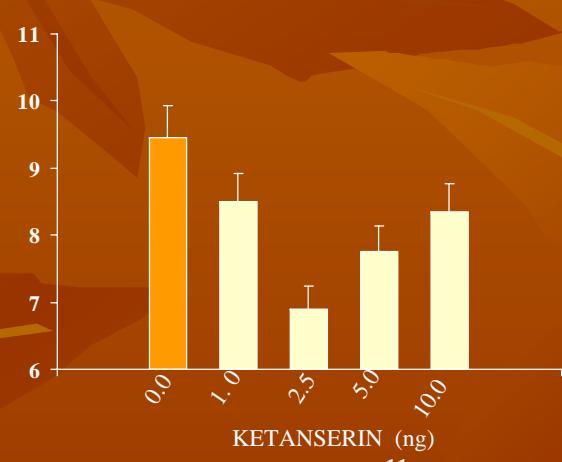

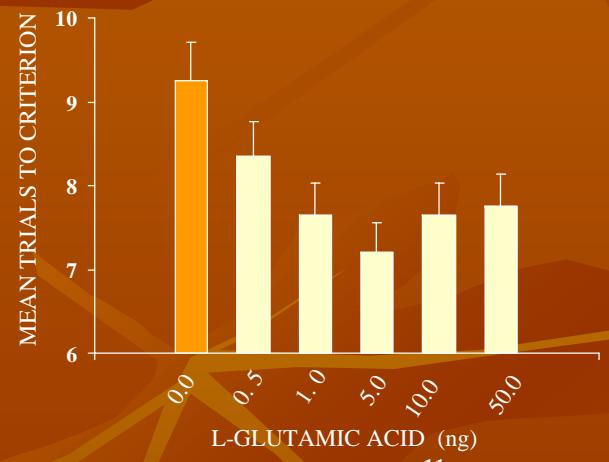

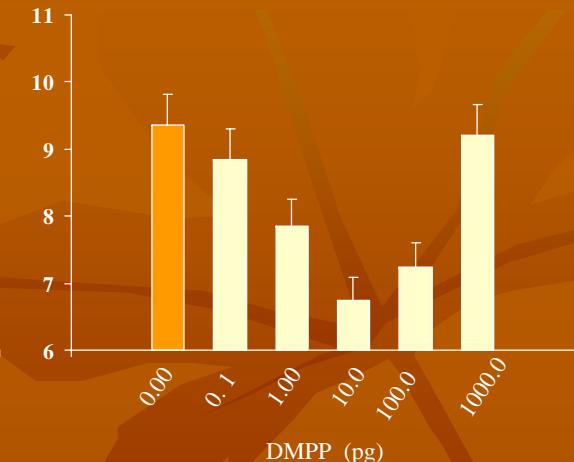

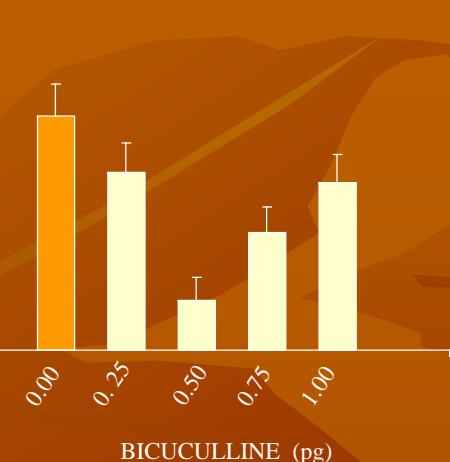

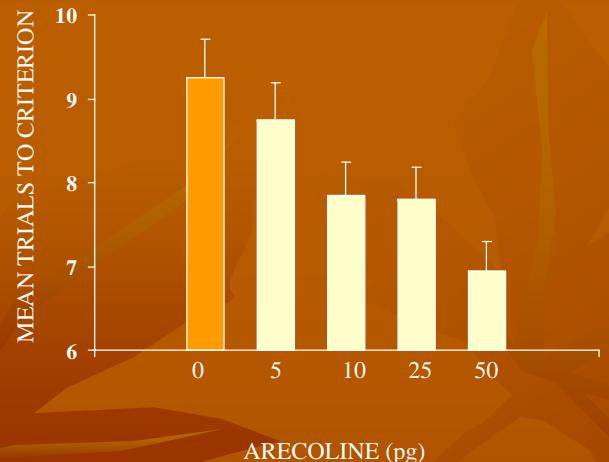

# GABA ANTAGONISTS (GABA-A & GABA-B)

# SEROTONIN ANTAGONISTS (HT-1 & HT-2)

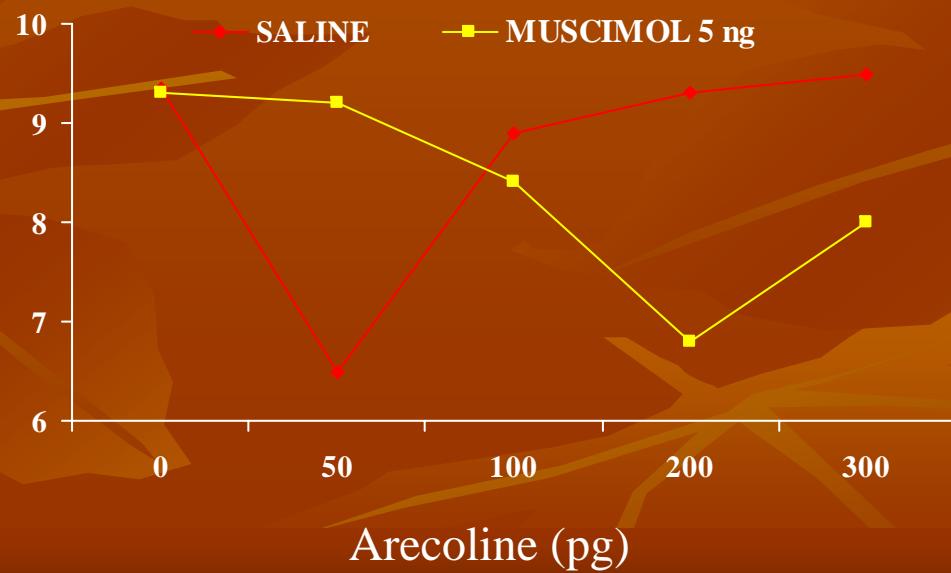

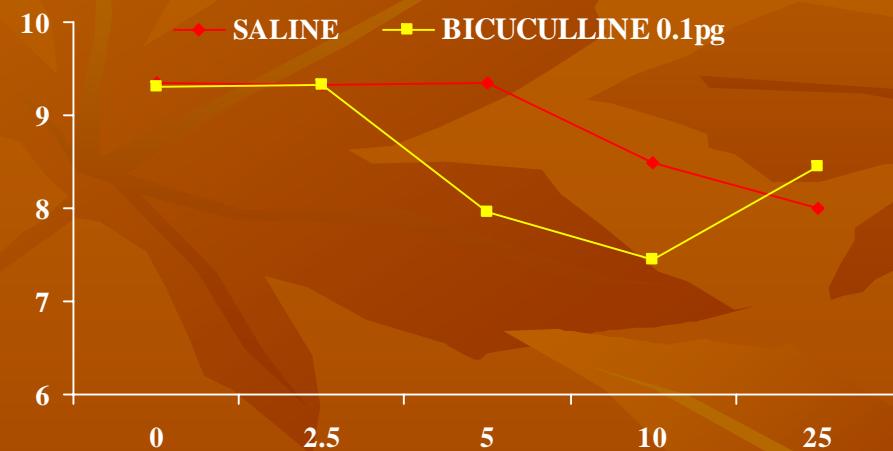

# MAMILLARY COMPLEX

# Hormesis is present in multiple brain sites

- Hippocampus
- Septum
- Mammillary bodies
- Amygdala
- Cingulate cortex

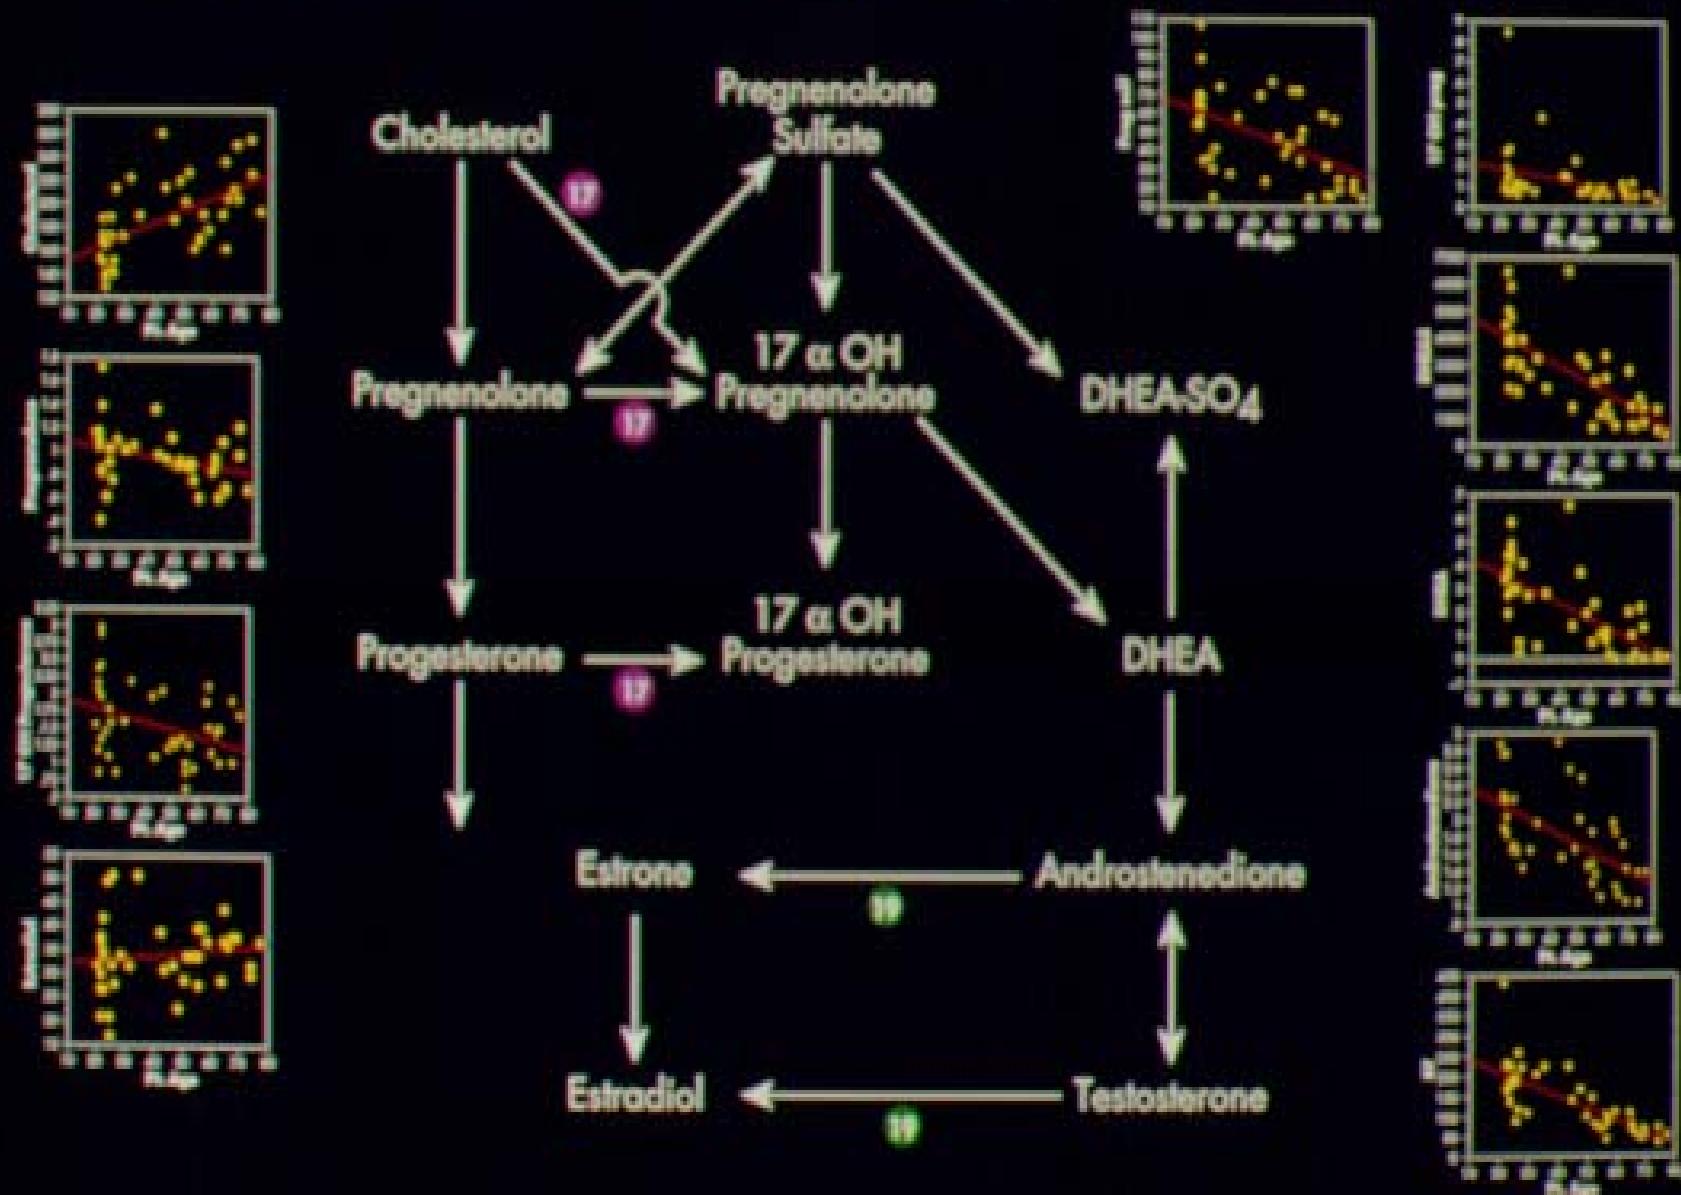

CO-ADMINISTERED  
Arecoline into hippocampus;  
GABA antagonist/agonist into septum

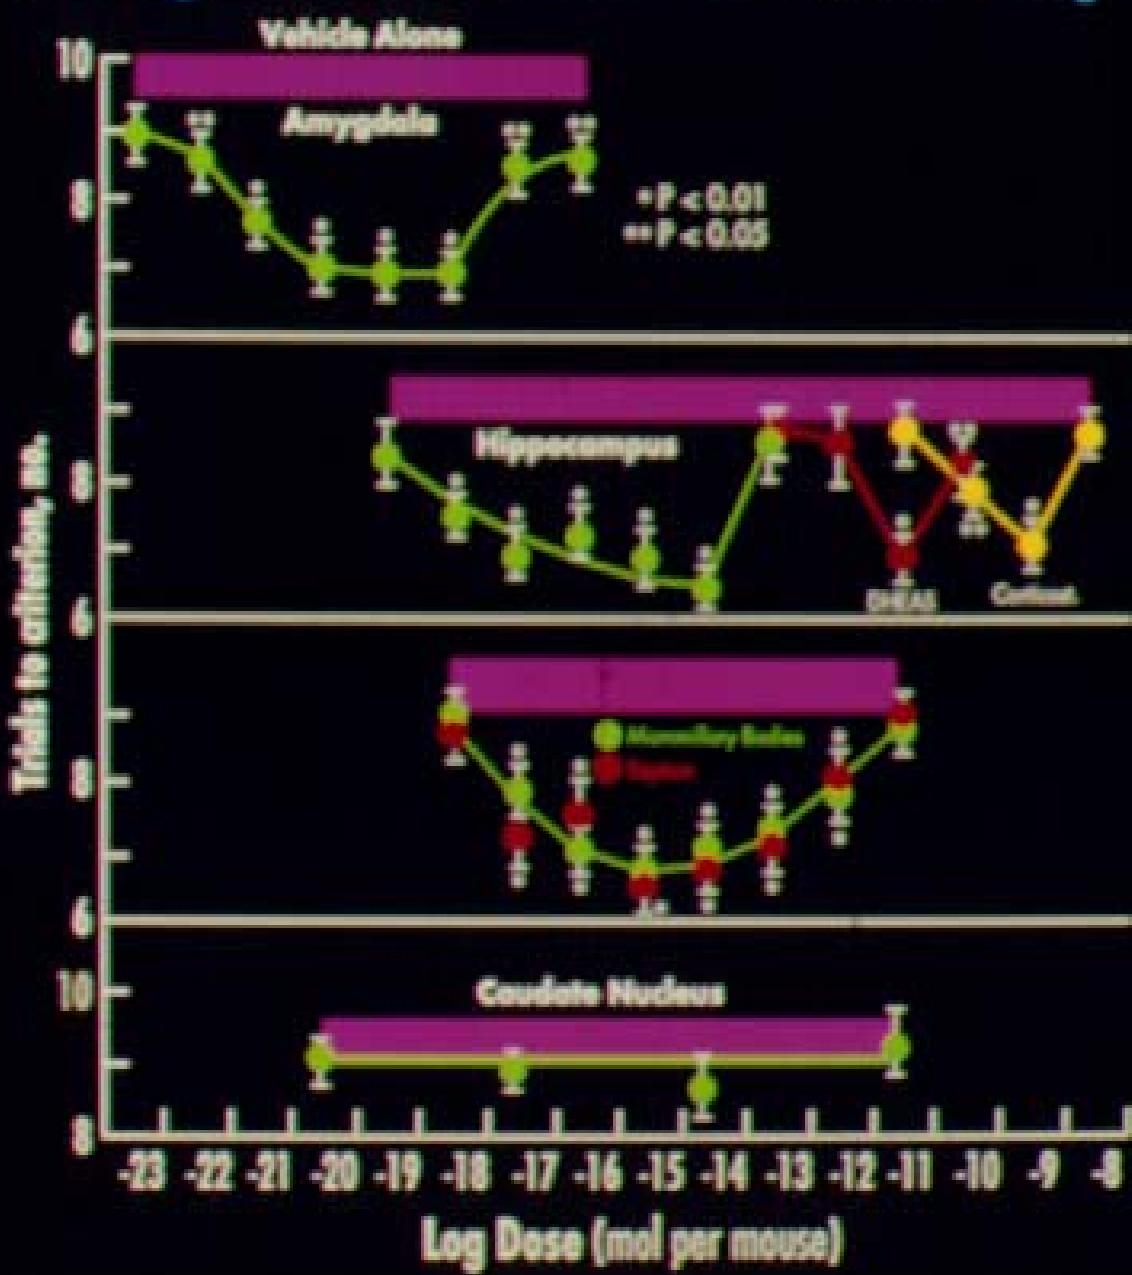

# The Fourth Golden Rule

Hormones that modulate memory  
follow the laws of hormesis

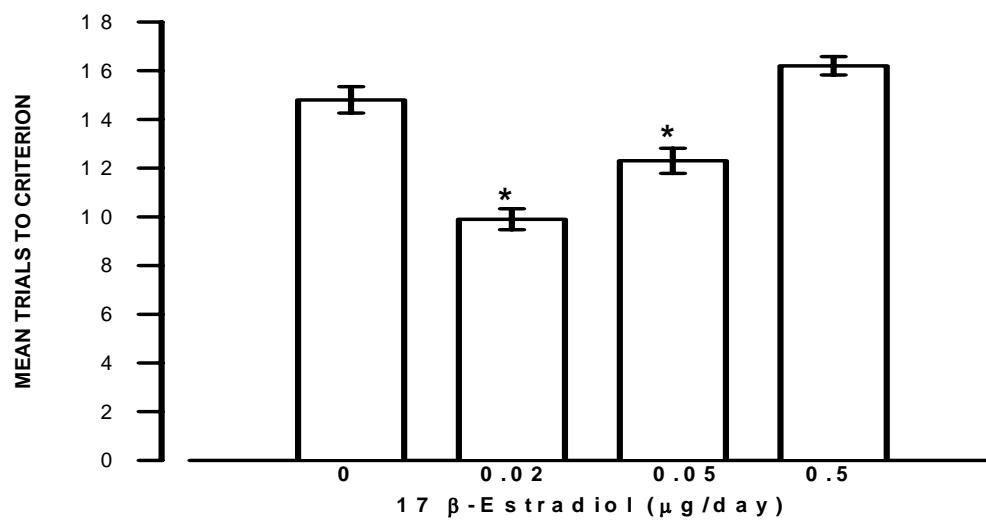

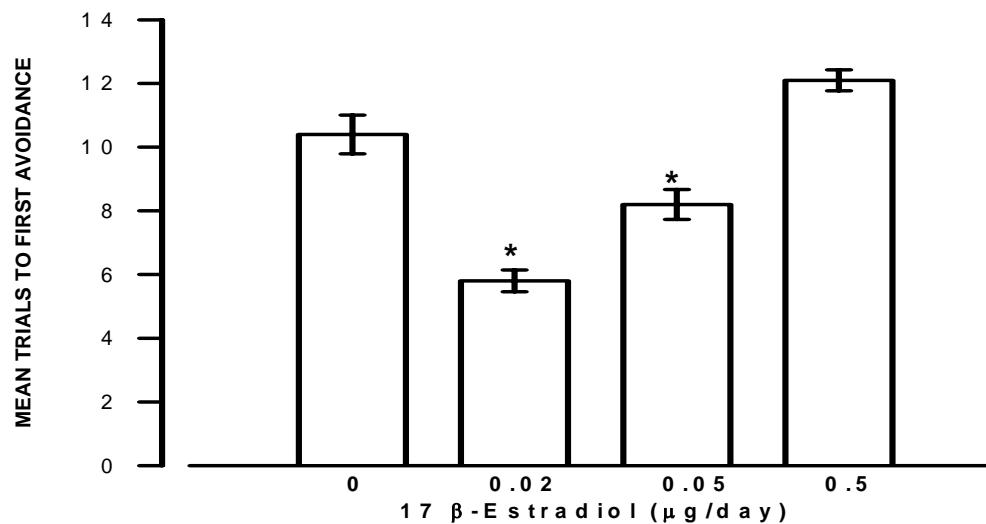

# Steroid Hormones and Aging in Males

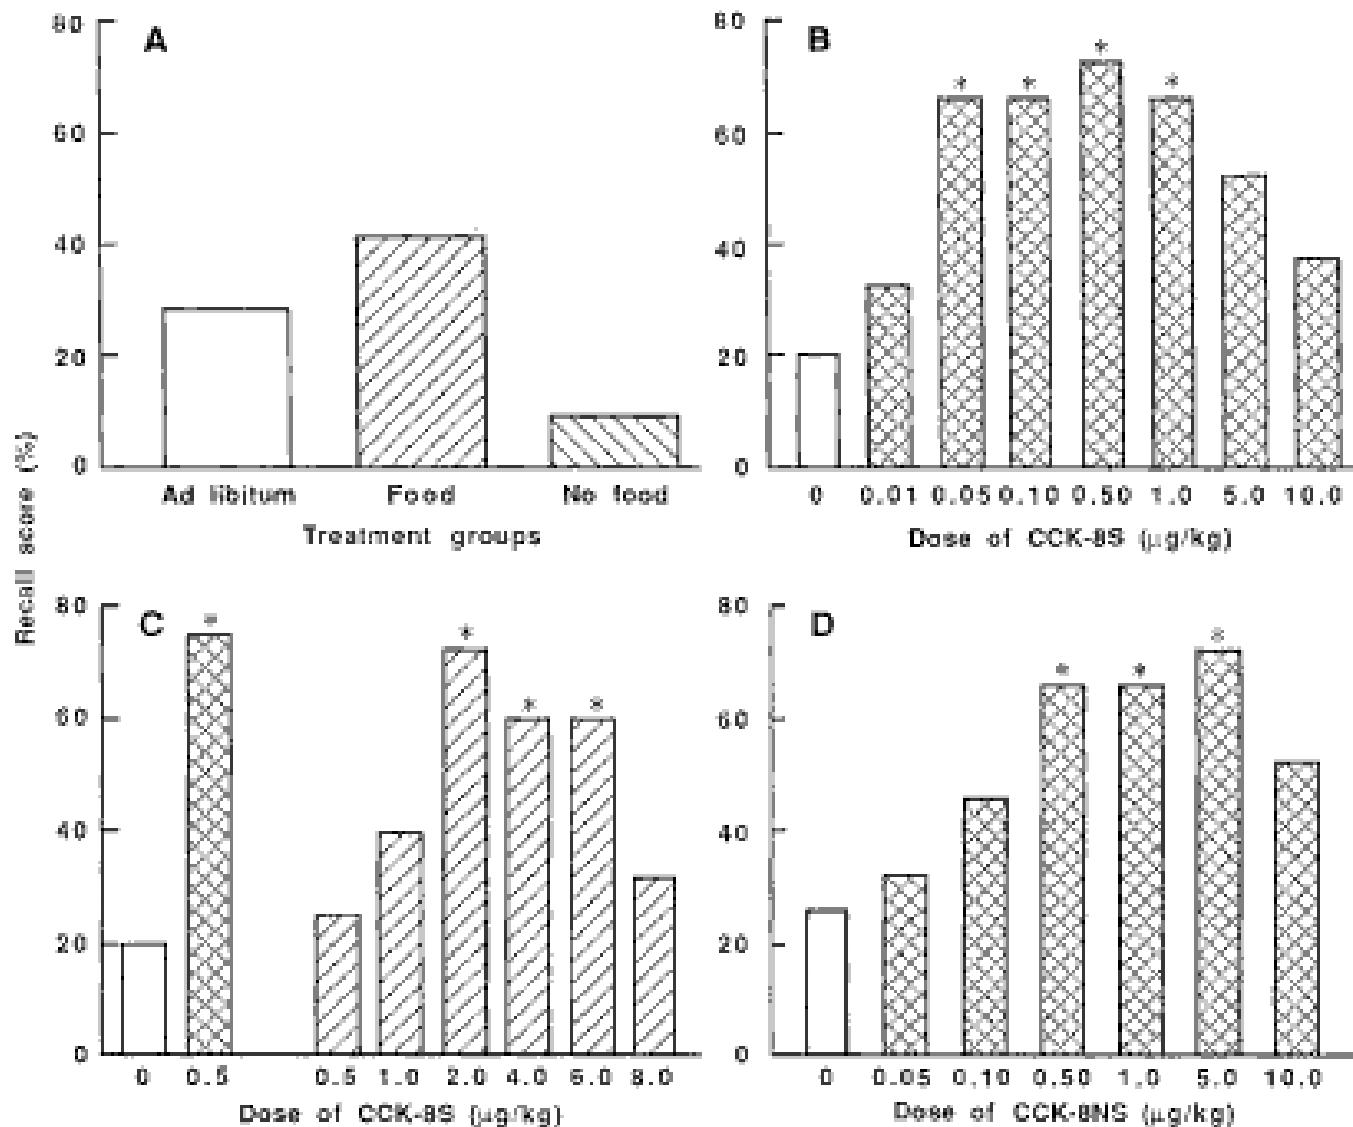

# Pregnenolone and Memory

# Food increases memory by releasing CCK

# The Gut-Brain Axis

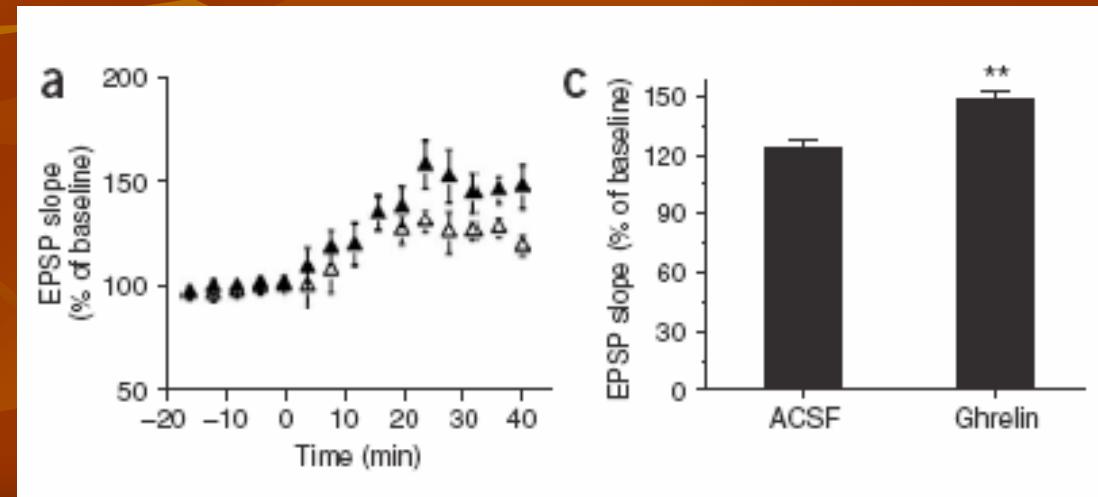

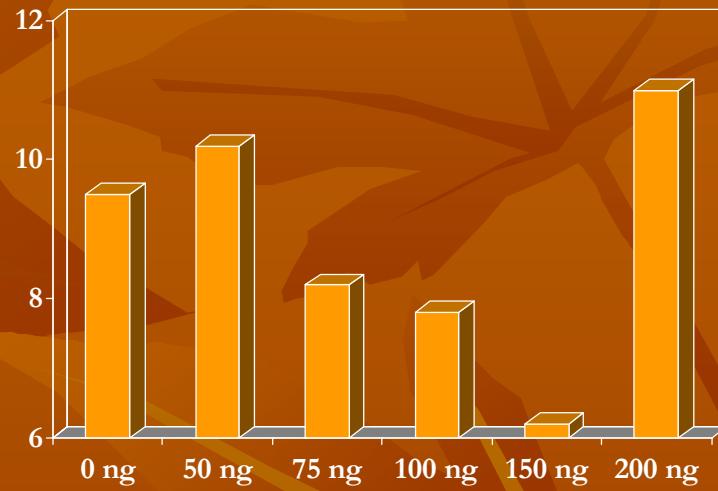

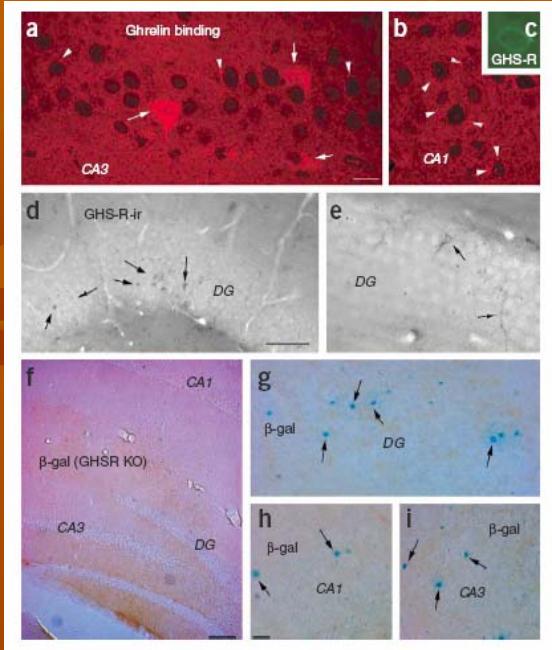

- Acquisition and retention of memories are enhanced by feeding immediately after learning and decreased by feeding prior to training
- Cholecystokinin enhances acquisition and memory with a bell-shaped dose response curve by activating the ascending fibers of the vagus. The pathway is Duodenum-vagus-NTS-amygdala-hippocampus
- Blocking the effect of cholecystokinin blocks the effect of feeding on memory

www.time.com AOL Keyword: TIME

The image consists of several panels. On the left, a large red 'TIME' logo is partially visible. Below it is a comparison of two brain scans: a 'Normal Brain' on the right and a 'Brain of Alzheimer's Sufferer' on the left, showing significant tissue loss and red/yellow highlights indicating damage. To the right of the brain scans is a portrait of a man with a mustache, likely Georges Cuvier. Above the portrait is text for a 'New Series Innovators' section. Below the portrait is the main title 'THE NEW SCIENCE OF ALZHEIMER'S' in large yellow letters, with a list of topics below it. At the bottom is the website 'www.time.com' and the AOL Keyword 'TIME'. On the right side of the image is a detailed diagram of a neuron. It shows a 'Healthy Neuron' with 'Dendrites', 'Axon', and 'Microtubules' supporting 'Tau Protein'. In contrast, a 'Diseased Neuron' shows 'Amyloid Plaque' and 'Disintegrating Microtubules'. Above the neuron diagram is a cross-section of a 'Healthy Brain' showing the 'Cerebral Cortex' and 'Hippocampus'. To the right of the neuron are three diagrams of brains labeled 'Mild Alzheimer's Disease', 'Moderately Enlarged Ventricles', and 'Severe Alzheimer's Disease', each showing increasing stages of cortical shrinkage, ventricle enlargement, and hippocampus shrinkage.

*Antisense to APP reverses memory deficits, oxidative damage and delayed AB clearance in mice models of Alzheimer's disease. It can be administered intranasally.*

Alois Alzheimer

*What is the physiological  
role of amyloid beta  
protein?*

# Low doses of Amyloid Beta Protein Enhance Memory

Effect of A $\beta$  1-42 on Retention of T-maze Footshock Avoidance

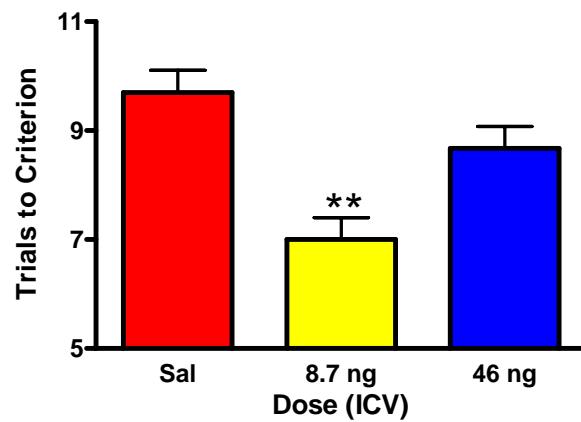

Figure 5. Low doses of A $\beta$  1-42 administered ICV immediately after training improves retention in T-maze footshock avoidance. The \*\* indicates P<0.01.

Effect of A $\beta$ 12-28 on Retention of T-maze Footshock Avoidance

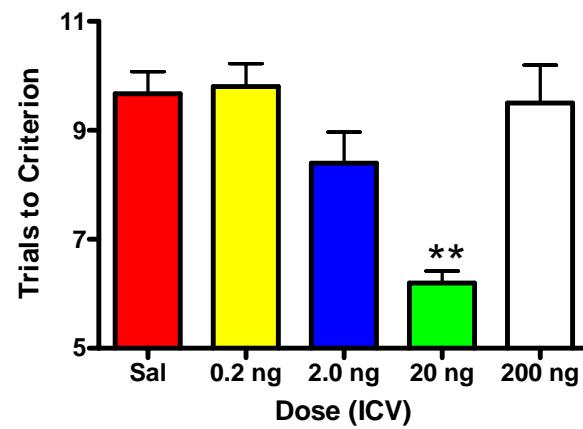

Figure 4. Low doses of A $\beta$  12-28 administered ICV immediately after training improves retention in T-maze footshock avoidance. The \*\* indicates P<0.01.

# Inhibition of Amyloid Beta Protein inhibits learning in young animals

Effect of Antibody to A $\beta$  72 hours Administered 72 hrs Prior to Training on Acquisition of T-maze Footshock Avoidance

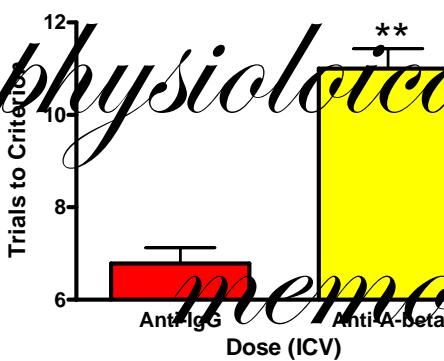

Figure 1: Antibody to A $\beta$  administered 72 hours prior to training in CD-1 mice impaired acquisition of T-maze footshock avoidance. The \*\* indicates P<0.01.

Effect of DFFVG 72 hours Administered 72 hrs Prior to Training on Acquisition of T-maze Footshock Avoidance

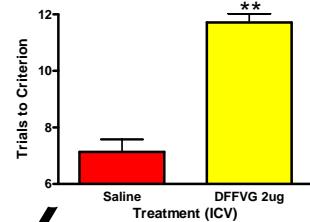

Figure 2. DFFVG which blocks the A $\beta$  from binding to the receptor impairs learning in young CD-1 mice. The \*\* indicates P<0.01.

Effect of Antisense to A $\beta$  Administered 3x Prior to Training on Acquisition of T-maze Footshock Avoidance

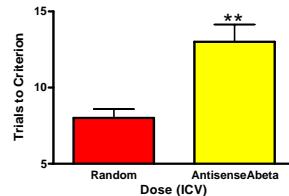

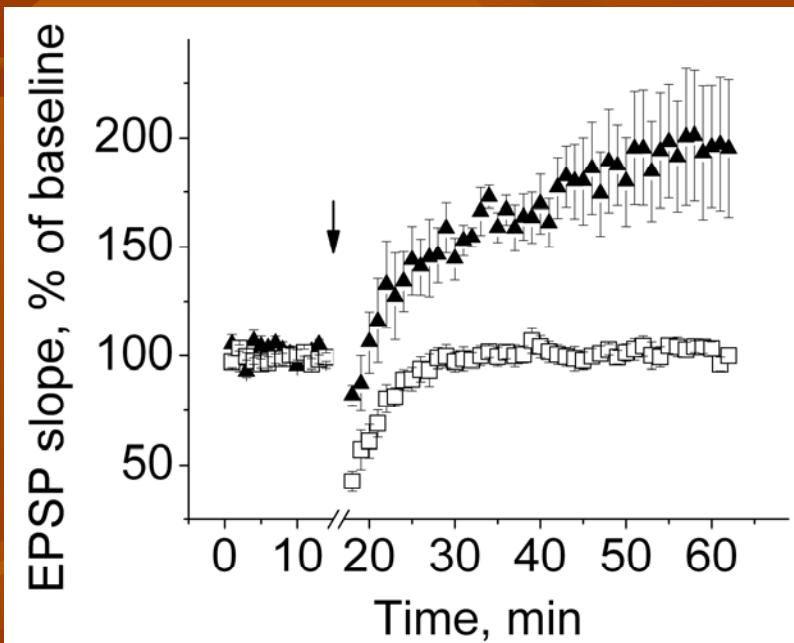

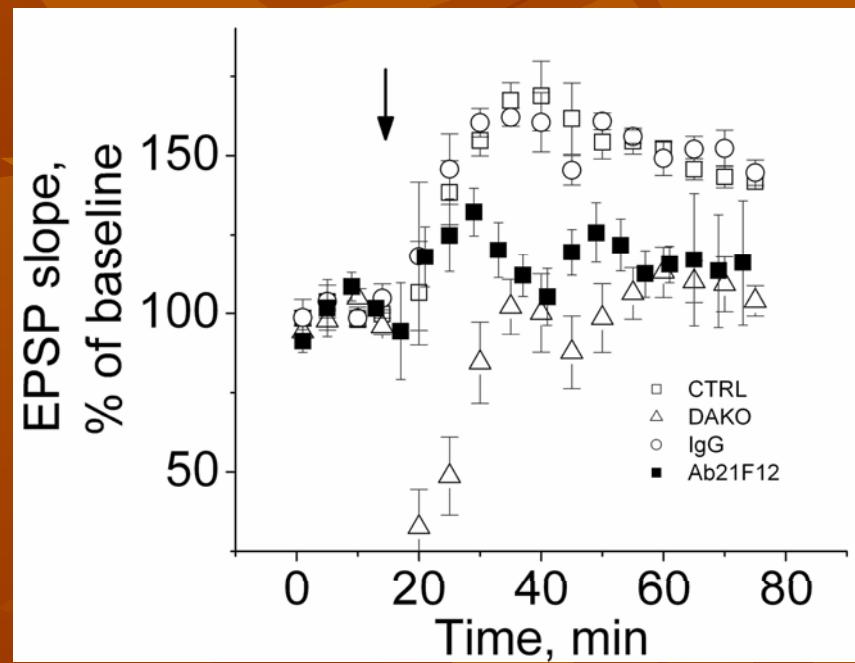

Figure 3. Antisense directed at the C-terminal portion of the APP peptide preventing the production of A $\beta$  impairs learning in young CD-1 mice. The \*\* indicates P<0.01.

The physiological role of beta-amyloid is memory enhancement

# Long Term Potentiation

DFFVG

Amyloid  $\beta$  antibodies

# Hormesis and Memory Conclusions

All (?) memory enhancing agents  
follow the laws of hormesis.

Low doses of amyloid  $\beta$  peptide  
the putative causative agent of  
Alzheimer's disease enhance  
memory
